

AUTOMATIC SYNC

TECHNOLOGIES

Automatic Sync Technologies provides automatic audio synchronization and searching tools and services for a wide range of multimedia production applications. Using leading-edge speech processing and pattern identification technology, Automatic Sync Technologies provides clients with improved quality and production throughput in the creation of synchronized multimedia content.

AST Products

- **ProductionSync™** is software that enables the automatic synchronization of a voice recording with visual media, such as animation or text. This software provides extremely accurate positional information for each lip position, word, sentence, or other event in the voice recording. This process is automatic and immediate, and can function with or without the text script of the voice recording. Available in SDK form for integration with your application or production pipeline.
- **InstantSync™** enables lip synchronization functionality for real-time communication applications. This software provides lip position information instantly as the sound is being received and played. Available in SDK form for integration with your application.
- **BookSync™** takes eBook text and voice recording data and automatically locates the exact position of each word and sentence (as well as paragraphs, chapters, etc.) in the voice recording. Conveniently available as a web-based service to provide fast and cost-effective book production.
- **CaptionSync™** automatically inserts captions or subtitling on recorded videotape, DVDs, or web video. Conveniently available as a web-based service to provide fast, accurate, and cost-effective captioning.
